

TECHNICAL INFORMATION:

The High Pressure Differential Sub is a tool which may be run in a TCP string or on the bottom of production tubing to maintain a high differential pressure in favor of the annulus (underbalance), while keeping fluid from entering the tubing. This tool features a convex ceramic dome which can withstand high differential pressures of up to 15,000psi imposed by fluid in the tubing-casing annulus.

A Drop Bar released from surface or pressure applied to the tubing is used to shatter the ceramic dome. The instant the dome fragments, a passage is created for reservoir fluids to surge into the tubing after the ceramic dome is broken out.

ADVANTAGES:

- The unique convex ceramic dome allows the tool to withstand a high differential pressure in favor of the annulus.
- High strength and consistent properties of ceramic allow a thin cross-section of the dome, ensuring better shattering properties than glass.

NOTE: When being used as a Pressure Barrier in Snubbing applications, Owen Oil Tools recommends a procedure is in place in the unlikely event the ceramic dome in this tool is compromised.
